

Accessing the Data

Climate Profiles are accessible on the Analytics Engine in several locations, depending on your needs.

Pregenerated files

An extensive set of pre-generated Standard Years and Typical Meteorological Years for weather station locations in California are available for direct download in two different locations:

1. Direct download and/or command line access via the [Cal-Adapt AWS catalog](#)
2. Direct download using the [Cal-Adapt Data Download Tool](#)

Custom climate profiles

To generate a custom climate profile using Python, including a custom GWL-based or time-based TMY, check out the Jupyter Notebook [custom_climate_profiles.ipynb](#), available on the Analytics Engine JupyterHub and in our public GitHub repository.
